In July and August of 1992, NASA's Langley Research Center will conduct flight tests of three airborne sensors designed to detect windshear, a hazardous weather condition that has been blamed for hundreds of airline fatalities. The effort is part of a NASA and Federal Aviation Administration program that will result in the installation of windshear warning systems on all commercial aircraft.

Enclosed is information about the program, including:

■ News release.
■ Background fact sheets.
■ Windshear graphic (available on Macintosh disk).
■ Color photos and illustrations.
■ How to request a video clip, computer disk or more photos.
■ Who to contact for interviews or more information.
